# Modeling climate extremes over West Africa and the Sahel

**Dr. Mouhamadou Bamba SYLLA** ([sylla.bamba@aims.ac.rw](mailto:sylla.bamba@aims.ac.rw); [syllabamba@yahoo.fr](mailto:syllabamba@yahoo.fr))  
AIMS Network Research Chair in Climate Change Science, Kigali, Rwanda  
Lead and Contributing Author, IPCC AR6, WG1 & WG2  
Member of the WMO Scientific Advisory Panel  
Vice-chair of R.A. I Research and Capacity Building Committee

# I/ The Context

**AIMS**

African Institute for  
Mathematical Sciences  
RESEARCH & INNOVATION

## □ Africa:

### State of the Climate in Africa 2023

- Temperature increases
- Multi-year droughts continued
- Extreme heat and floods hit
- Increasing climate change bill
- Early warnings for all

# I/ The Context ...

**As the climate warms...**

**Africa will have to brace in the  
future for more hazards that will  
lead to disasters**

**Or to prepare for new opportunities**

**Robust climate information  
EW4A ---> DRR**

# II/ Climate Modeling

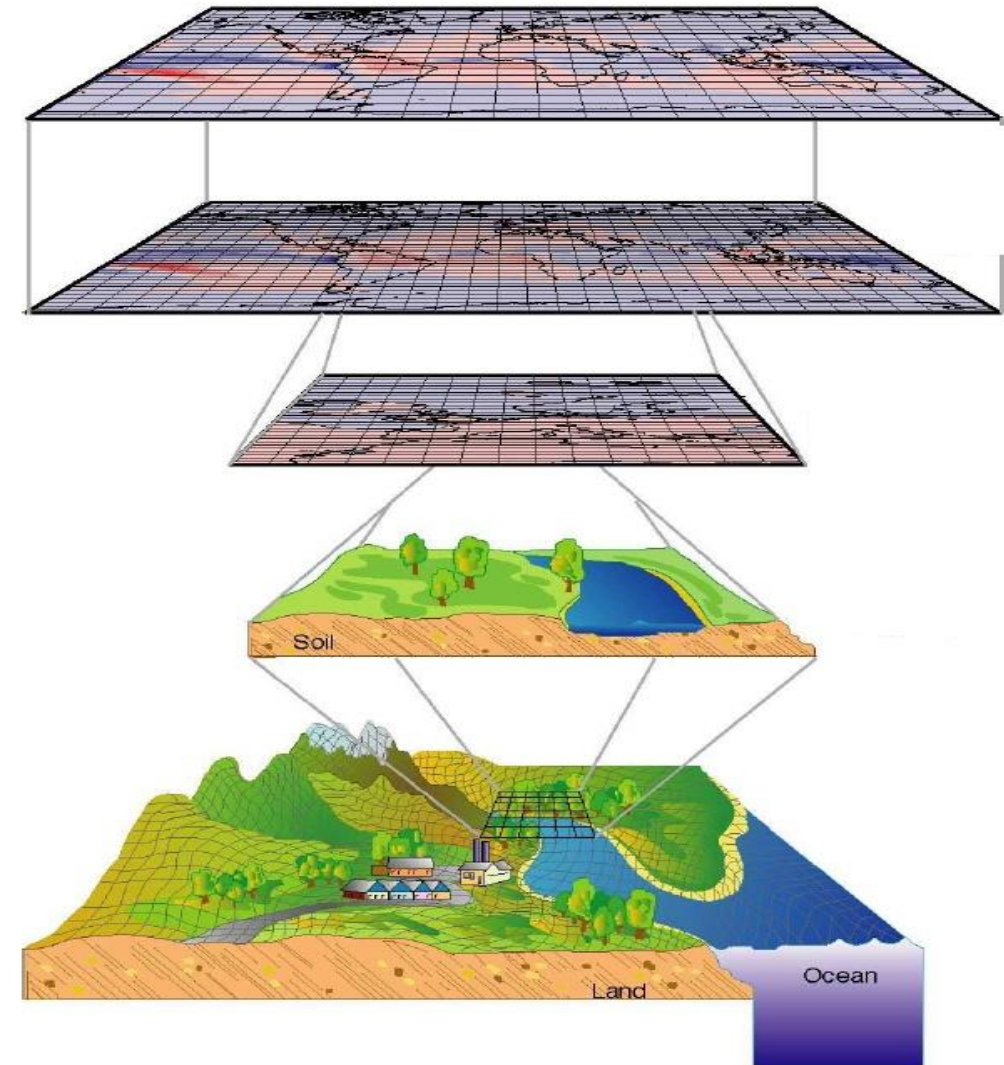

**AIMS**

African Institute for  
Mathematical Sciences  
RESEARCH & INNOVATION

Climate models are systems of differential equations based on the basic laws of physics

They characterize how energy and matter interact to drive the different components of the Earth's climate system

Downscaling

Schematic of Climate Models

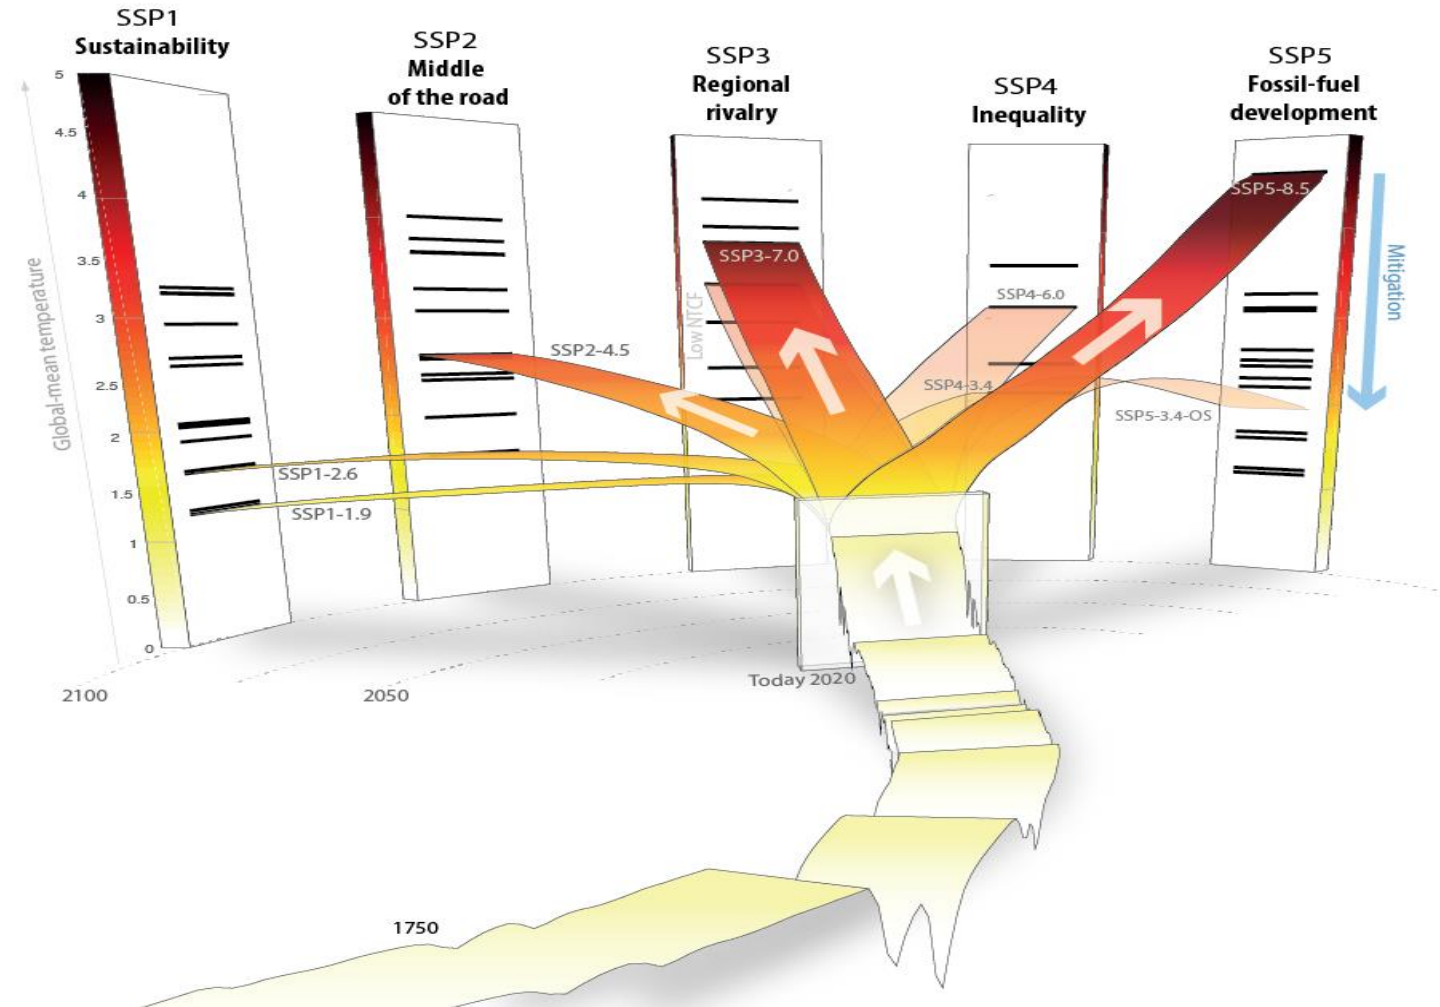

# II/ Climate Modeling

**AIMS**

African Institute for  
Mathematical Sciences  
RESEARCH & INNOVATION

## - Forcing scenarios

- The five socio-economic SSP families

- SSP scenarios

- Branches of the respective scenarios along the different socio-economic SSP families

# II/ Climate Modeling

## ➡ CMIP6: GCMs and ESMs

- For climate change studies: Historical, ScenarioMIP, HighResMIP
- More than 30 GCMs/ESMs have made available daily data
- SSP1-2.6; SSP2-4.5; SSP5-8.5

## ➡ CORDEX: RCMs

- For climate change studies: Evaluation, Historical and Projections – Downscaling CMIP5
- More than 20 RCMs experiments available
- RCP4.5, RCP8.5

## ➡ CORDEX2: Downscaling CMIP6 – about to start

	Questions			Grand science challenges						
	Response to Forcing	Systematic Errors	Variability, Prediction & Projection	Clouds, circulation, sensitivity	Melting ice	Climate extremes	Changes in water availability	Regional sea level change	Biogeochemistry	Near term prediction
AerChemMIP	●		○						●	○
C4MIP	●		○				○		●	
CFMIP	●	○		●			○			
DAMIP	●		○		○	●				
DCPP	○		●				○	○		●

# III/ Simulations of Extremes

## ☐ Extreme precipitations

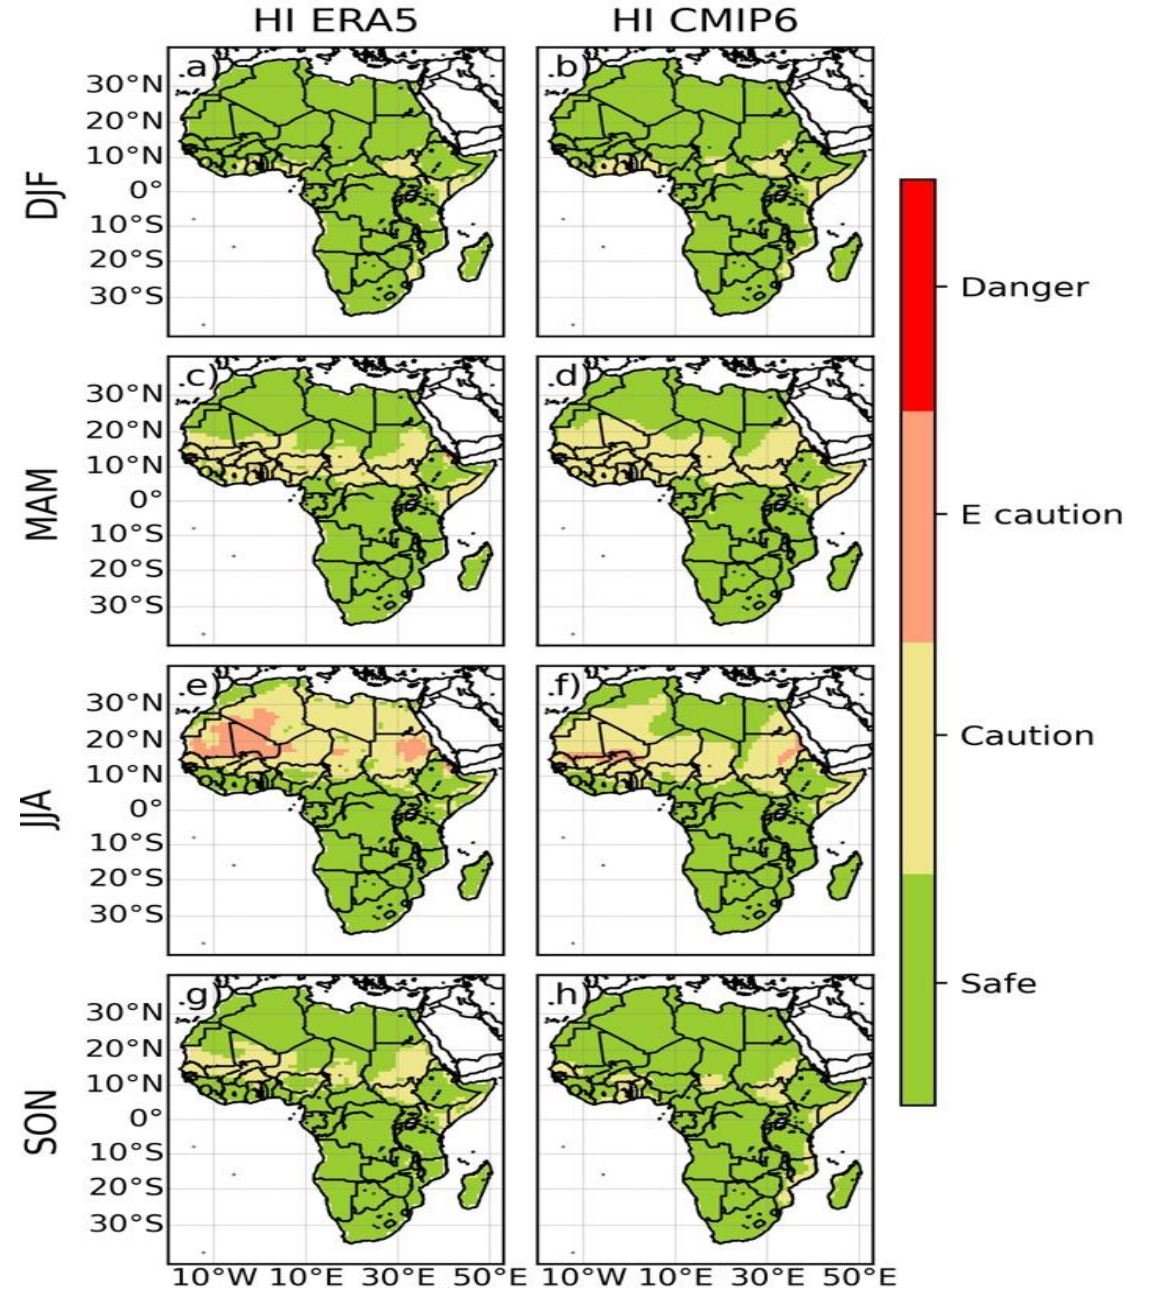

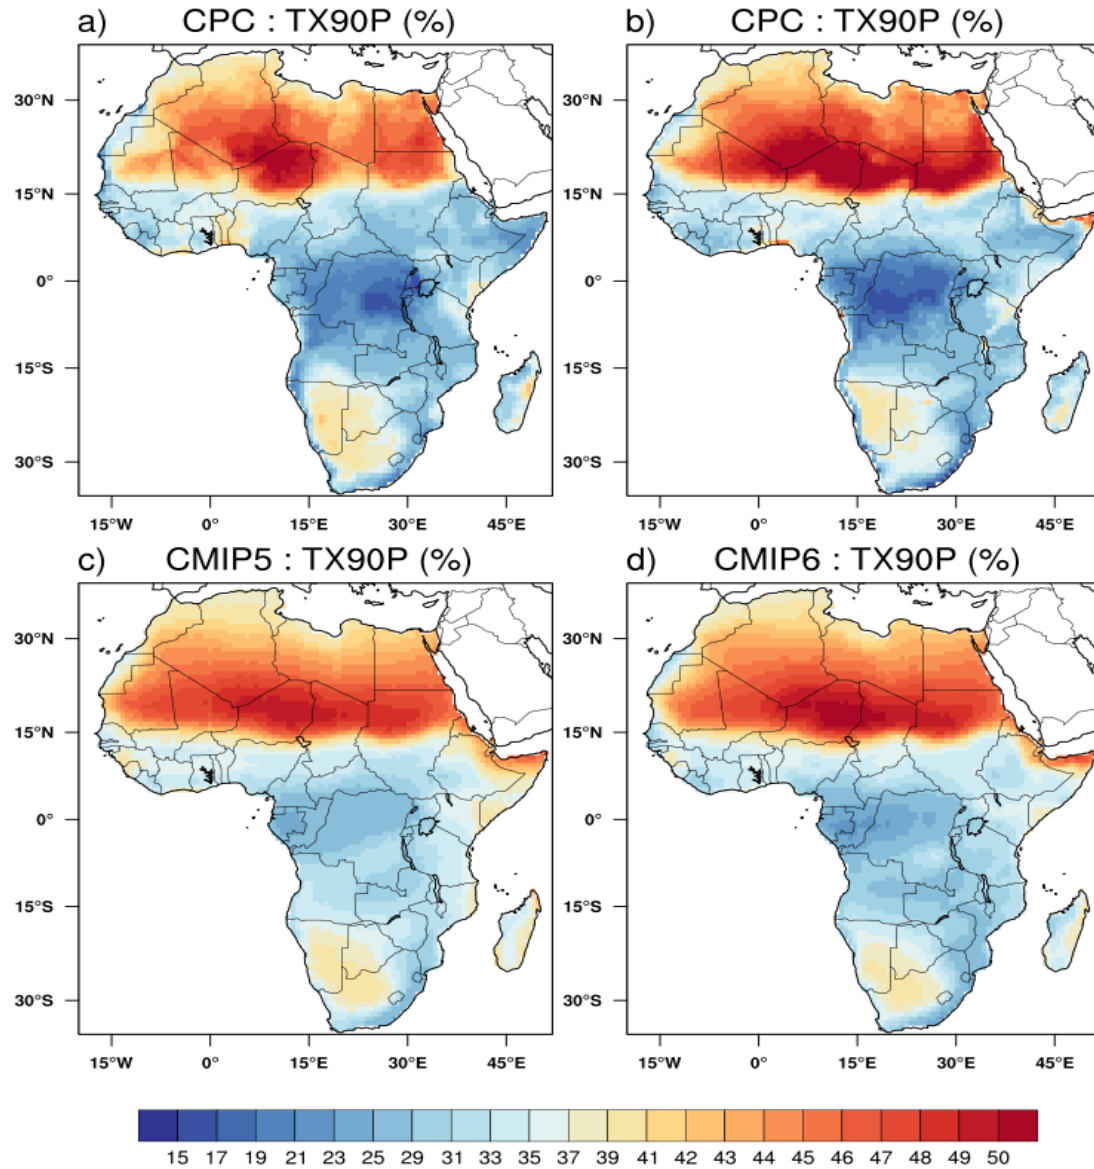

- Biased simulations in Africa
- Uncertain changes in many areas
- CMIP6 sees some improvements

# III/ Simulations of Extremes

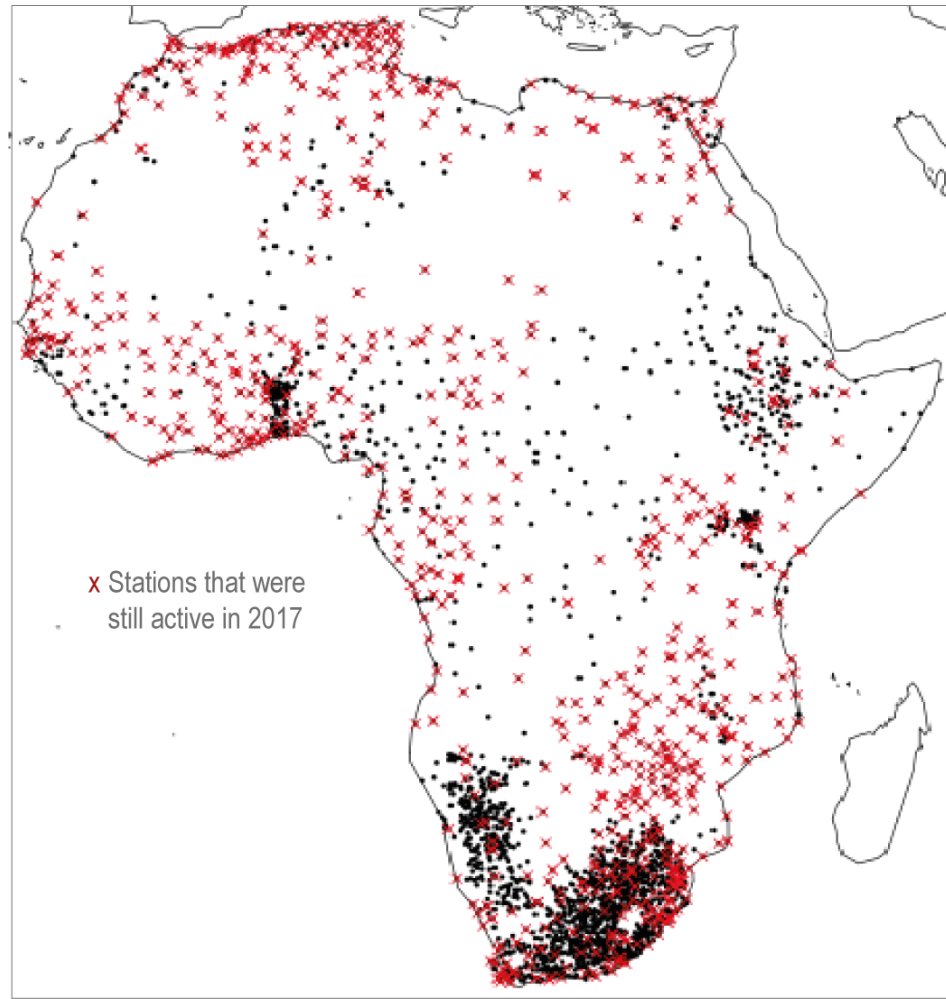

## ☐ Extreme heat

## □ Data and validation issues

- Large regions in Africa lack good quality data

(a) Distribution of weather stations since 1950

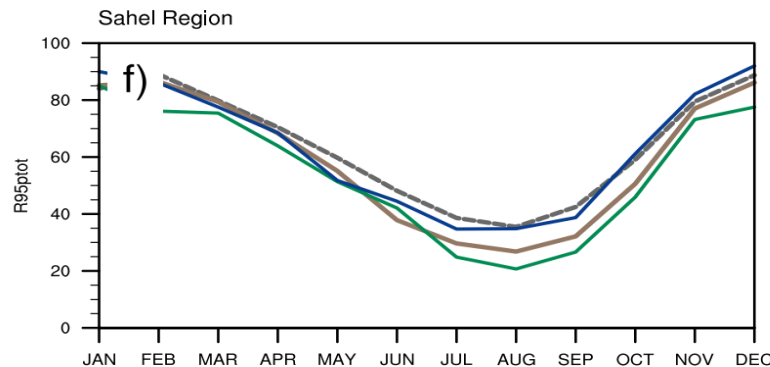

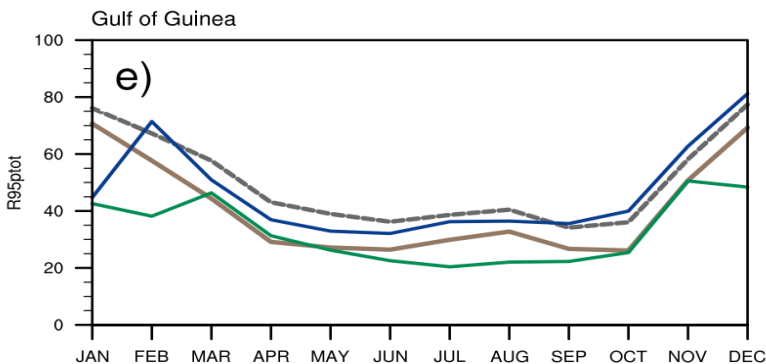

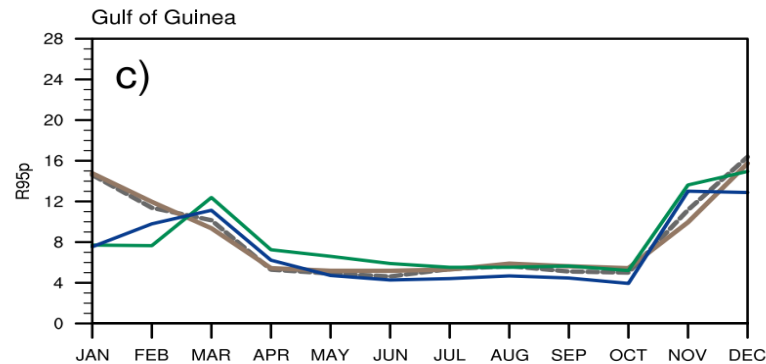

(b) Number of weather stations since 1950

## □ Data and validation issues

- LR simulations follow LR products
- HR simulations follow HR products

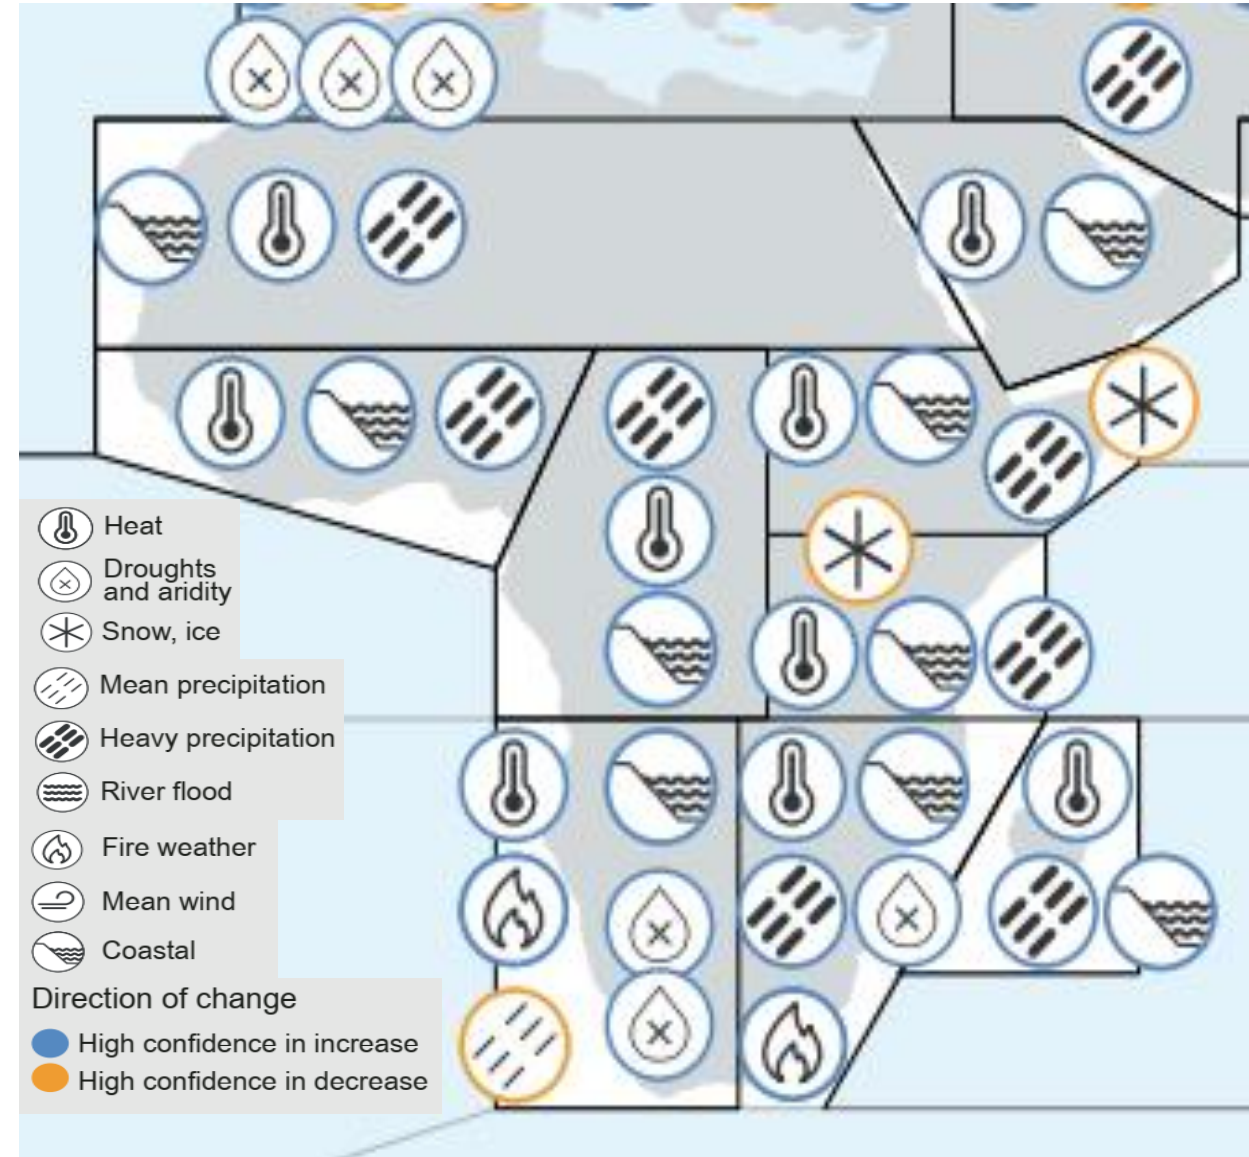

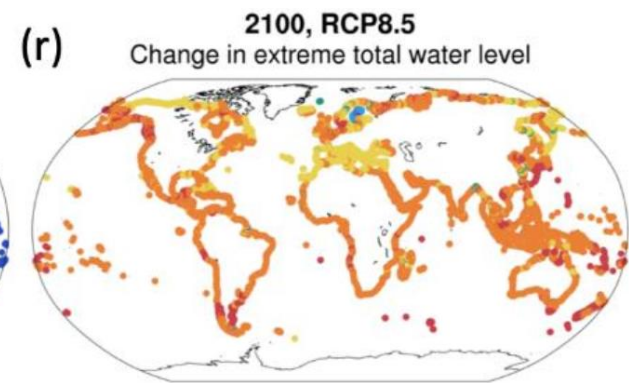

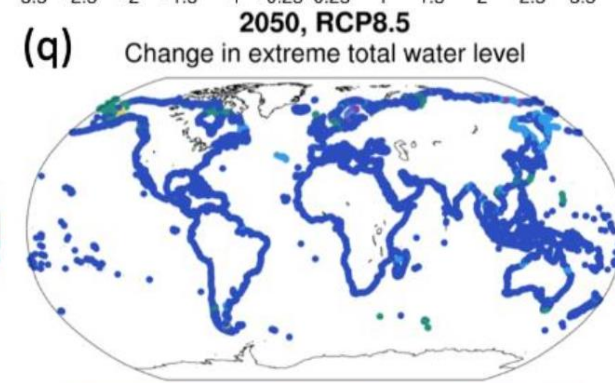

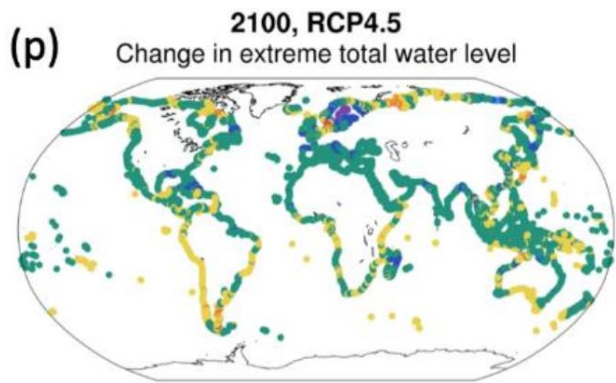

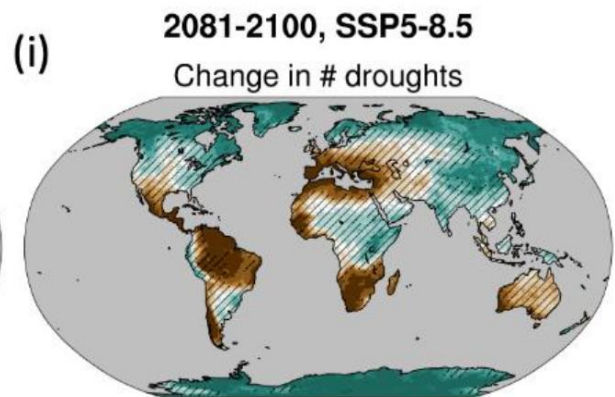

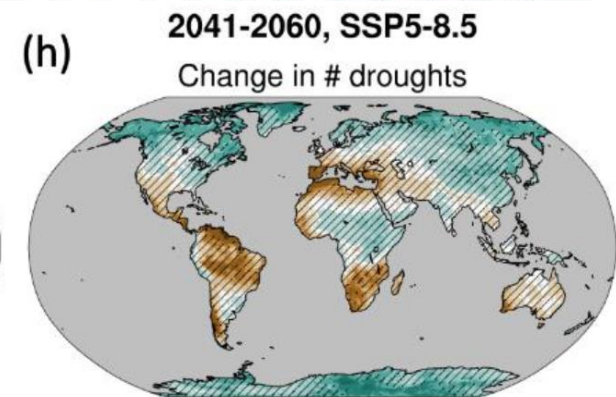

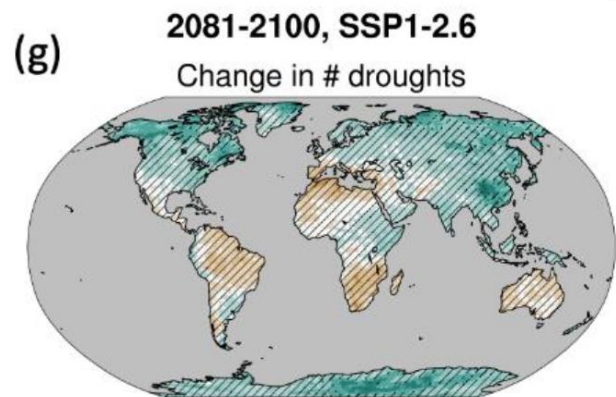

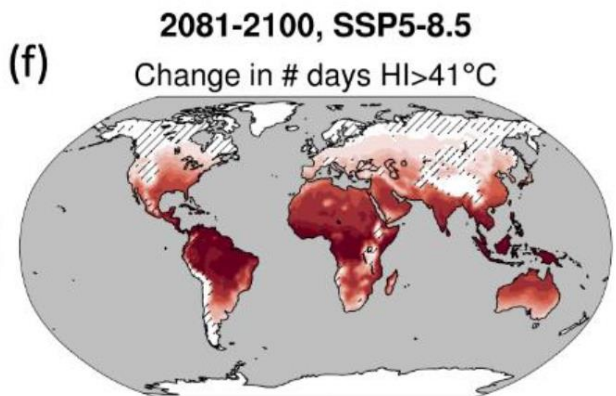

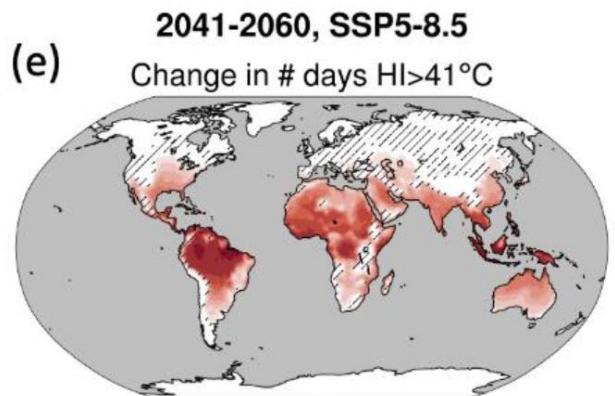

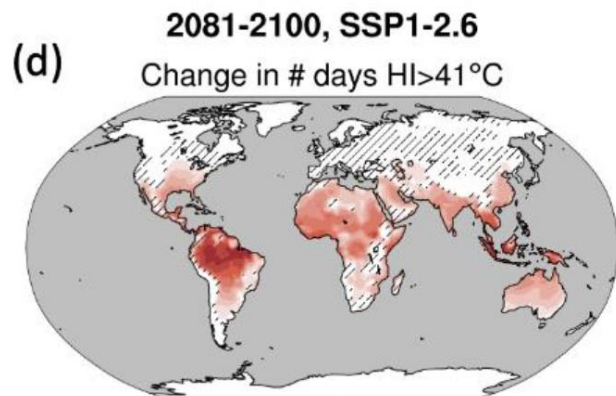

# III/ Future climate extremes

Multiple climatic impact-drivers are projected to change in all regions of the world, especially in Africa

- Most common changes: Heat, Coastal and Heavy Precipitation
- Southern Africa: Drought and Fire Weather show up
- Eastern Africa: Decreased Snow/Ice coverage emerges

Colors > 80% model agreement  
 // // // < 80% model agreement

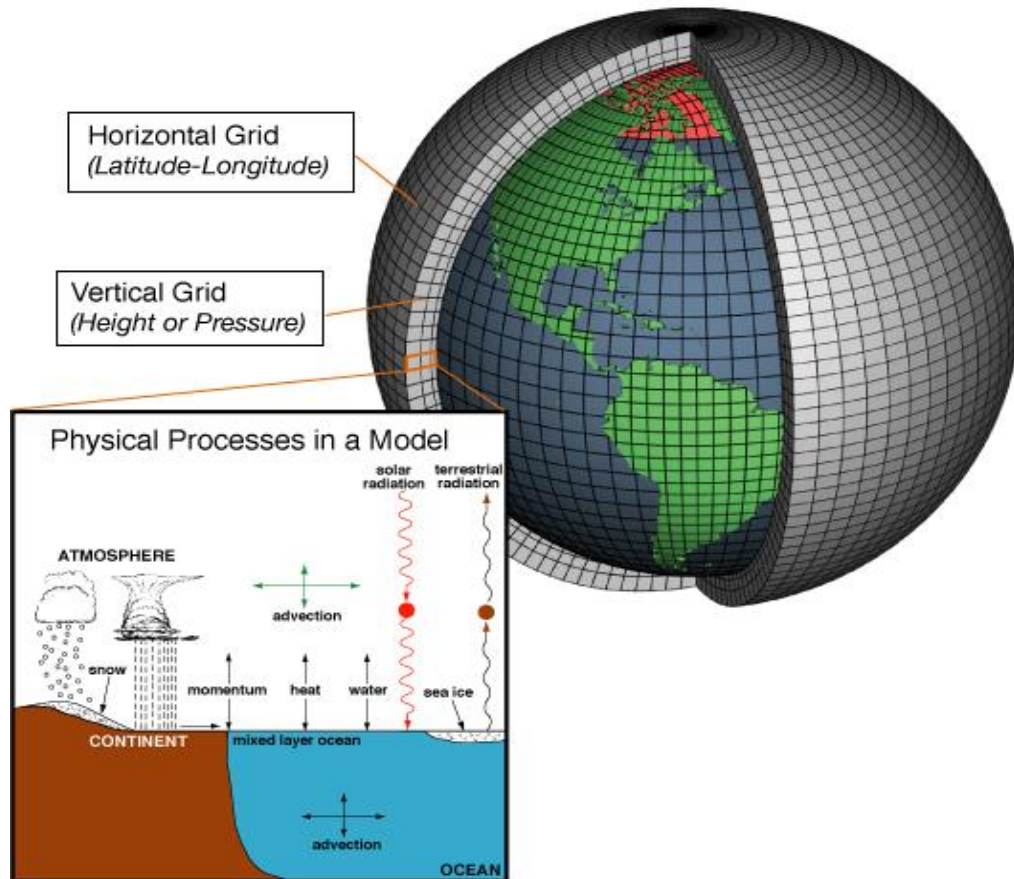

# IV/ Opportunity brought by AI

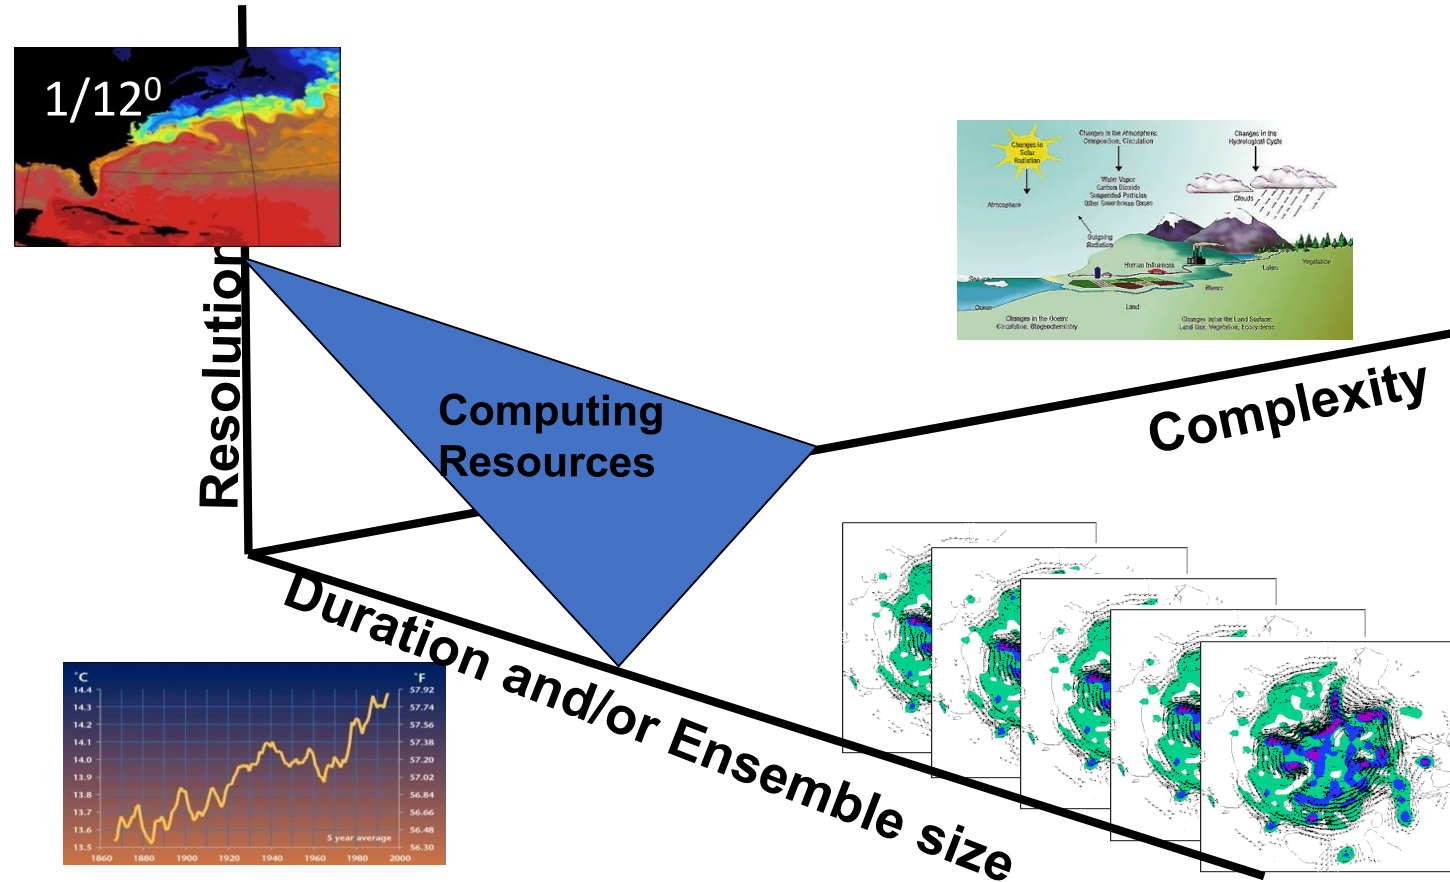

## □ Observational data and climate modeling

### Schematic of climate models

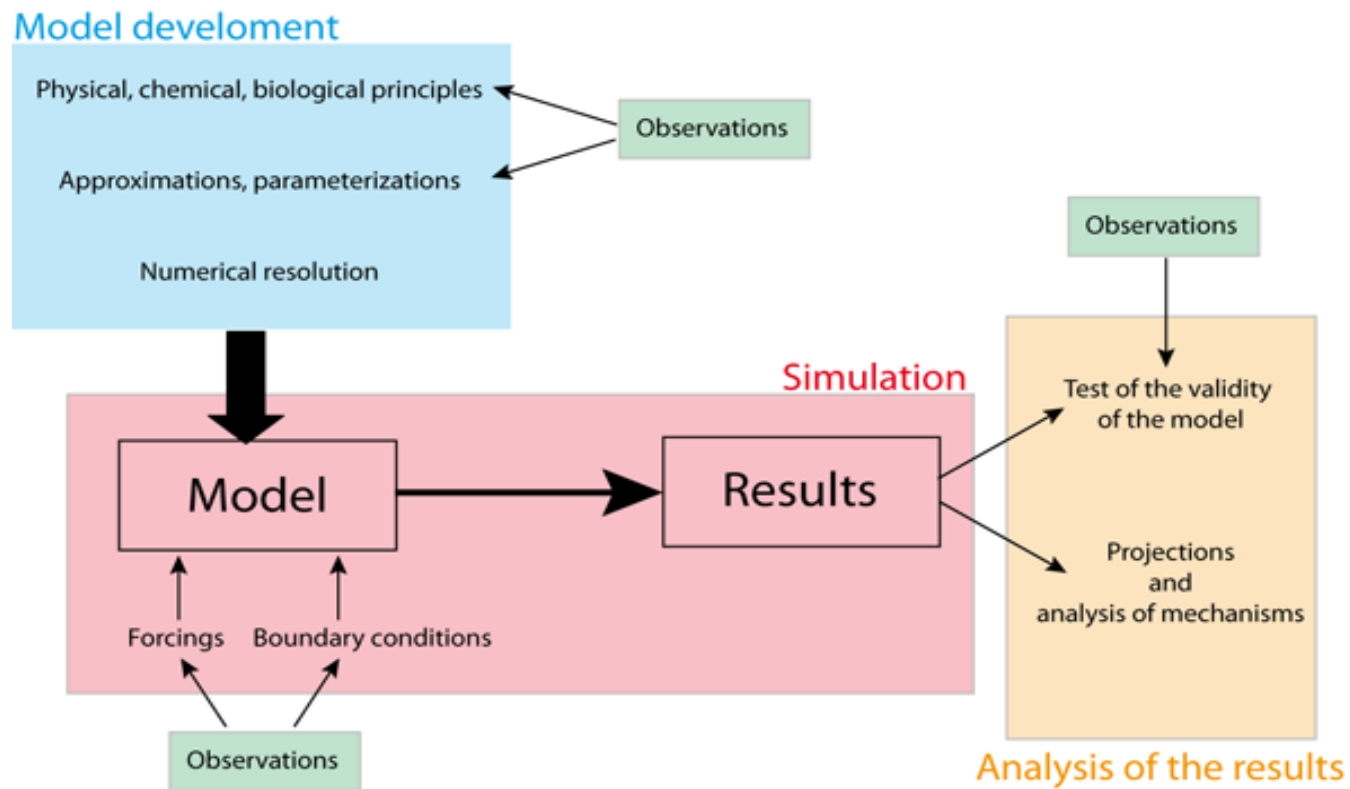

### Improving climate models

## □ Observational data and climate modeling

### Workflow

- Climate data monitoring, quality control, data fusion from different sources
- Emulate model components, develop improved parametrization schemes, learn the underlying equations of motion
- Better-suite boundary forcings, physical consistency
- Bias correction, feature detection, multimodel ensembling, uncertainty quantification, further downscaling

The potential of machine learning application learning lies everywhere in the workflow

## V/ Summary and Conclusion

- Climate Models are well advanced to provide “reliable” climate change projections under greenhouse gas forcings (i.e. future Worlds)
- Some bias exist in the observed climate extremes
- Some bias exist in the simulated climate extremes
- The projections should be tailored and relevant sectorial indices (i.e. CID) developed
- Droughts, Floods, Heatwaves, Sea level rise will drastically increase in WA --> Disasters
- EW4A --- > climate information in a climate service framework -- DRR
- Bring AI into play to improve the information
